

What is Pair Programming?

Pair Programming is a collaborative software development practice where two programmers work together at one workstation.

What is Pair Programming?

Roles

- **Driver:** The person who writes the code.
- **Navigator:** The person who reviews the code as it is written, providing suggestions and identifying potential issues.

What is Pair Programming?

Benefits

- **Enhanced Code Quality:** Continuous code review helps catch errors early.
- **Knowledge Sharing:** Promotes the exchange of ideas and best practices between team members.
- **Increased Collaboration:** Improves communication and teamwork skills.
- **Problem-Solving:** Two minds working together can solve problems more efficiently.

What is Pair Programming?

Challenges

- **Time-Consuming:** Can be slower than solo programming for simple tasks.
- **Compatibility:** Requires good teamwork and compatibility between partners

What is Pair Programming?

Best Practices

- **Regularly Rotate Roles:** Ensure both partners experience driving and navigating.
- **Clear Communication:** Maintain open and continuous communication.
- **Frequent Breaks:** Take regular breaks to maintain focus and productivity.
- **Balanced Workload:** Ensure tasks are evenly distributed to keep both programmers engaged.
