

Measuring the Central Tendency: (2) Median

□ Median:

□ Middle value if odd number of values, or average of the middle two values otherwise

□ Estimated by interpolation (for *grouped data*):

<i>age</i>	<i>frequency</i>
1–5	200
6–15	450
16–20	300
21–50	1500
51–80	700
81–110	44

Approximate
median

Sum before the median interval

Interval width ($L_2 - L_1$)

$$median = L_1 + \left(\frac{n/2 - (\sum freq)_l}{freq_{median}} \right) width$$

Low interval limit
