

Handling Outliers: From K-Means to K-Medoids

- ❑ The K-Means algorithm is sensitive to outliers
 - ❑ An object with an extremely large value may substantially distort the distribution of the data
- ❑ K-Medoids: Instead of taking the mean value of the object in a cluster as a reference point, medoids can be used, which is the most centrally located object in a cluster
- ❑ The K-Medoids clustering algorithm:
 - ❑ Select K points as the initial representative objects (i.e., as initial K medoids)
 - ❑ Repeat
 - ❑ Assigning each point to the cluster with the closest medoid
 - ❑ Randomly select a non-representative object o_i
 - ❑ Compute the total cost S of swapping the medoid m with o_i
 - ❑ If $S < 0$, then swap m with o_i to form the new set of medoids
 - ❑ Until convergence criterion is satisfied

PAM: A Typical K-Medoids Algorithm

$K = 2$

Arbitrary
choose K
object as
initial
medoids

Assign
each
remaining
object to
nearest
medoids

Randomly select a non-
medoid object, O_{random}

Compute
total cost of
swapping

Select initial K medoids randomly

Repeat

Object re-assignment

Swap medoid m with o_i if it
improves the clustering quality

Until convergence criterion is satisfied

Swapping O
and O_{random}
If quality is
improved
