

Coding Discussion: String Hashing, Duplicate Removal, and Anagram Detection

Design and Analysis of Algorithms

Brian C. Dean

**School of Computing
Clemson University**

Goals

- Input: file containing 1 million strings (English words)
- **Goal #1:** Determine how many distinct words are present (i.e., remove duplicates)
- **Goal #2:** Find all pairs of anagrams in this word set.
- Two strings are anagrams if they have the same letter counts, or equivalently if they are the same when their letters are sorted.
E.g., “CLEMSONTIGERS” is an anagram of “SCORESMELTING”.
